

Pterosaur in Pennsylvania

A **Pennsylvania pterosaur** has been reported, not a fossil in the Pennsylvanian strata but a living pterosaur.

In the summer of 2006, at about 8:00 p.m., . . . in southwest Greensburg, Pennsylvania, a karate teacher and two of his students were talking outside. Above some small trees . . . they saw something that at first could have been mistaken for a large bird. . . . [The karate teacher said:] it caught my eye. Being that far up the "birds" body still appeared to be much larger than my 100 pound dog . . . The wingspan appeared to be at least six feet and although it was a bit away from us you could clearly make out a long "horn" or "cone" type protrusion coming out of the back of its skull . . . [The head] was at the end of an elongated neck.

Eyewitnesses in other America states have reported similar flying creatures, apparent pterosaurs.

American Eyewitnesses of Living Pterosaurs

Reports of living pterosaurs in the United States of America are no longer confined to reports from cowboys in nineteenth-century Arizona or a police officer in twentieth-century San Bernito, Texas. According to one cryptozoologist, Jonathan Whitcomb, there may be 1400 eyewitnesses of living pterosaurs seen in the United States, during the past three decades.
